# PORTFOLIO - ANNA LOKHMATOVA

Selected learning projects from my Junior Frontend course. Each example demonstrates specific HTML/CSS/JS skills I am developing. A GitHub repository and full study project will be added as I progress.

1. Space Animation Project

SVG motion, keyframes, layered background

Animated night sky scene created using SVG graphics and CSS keyframe animation. Implemented moving UFO, rockets and glowing moon. Practised positioning, layering, and working with developer tools to refine layout and motion.
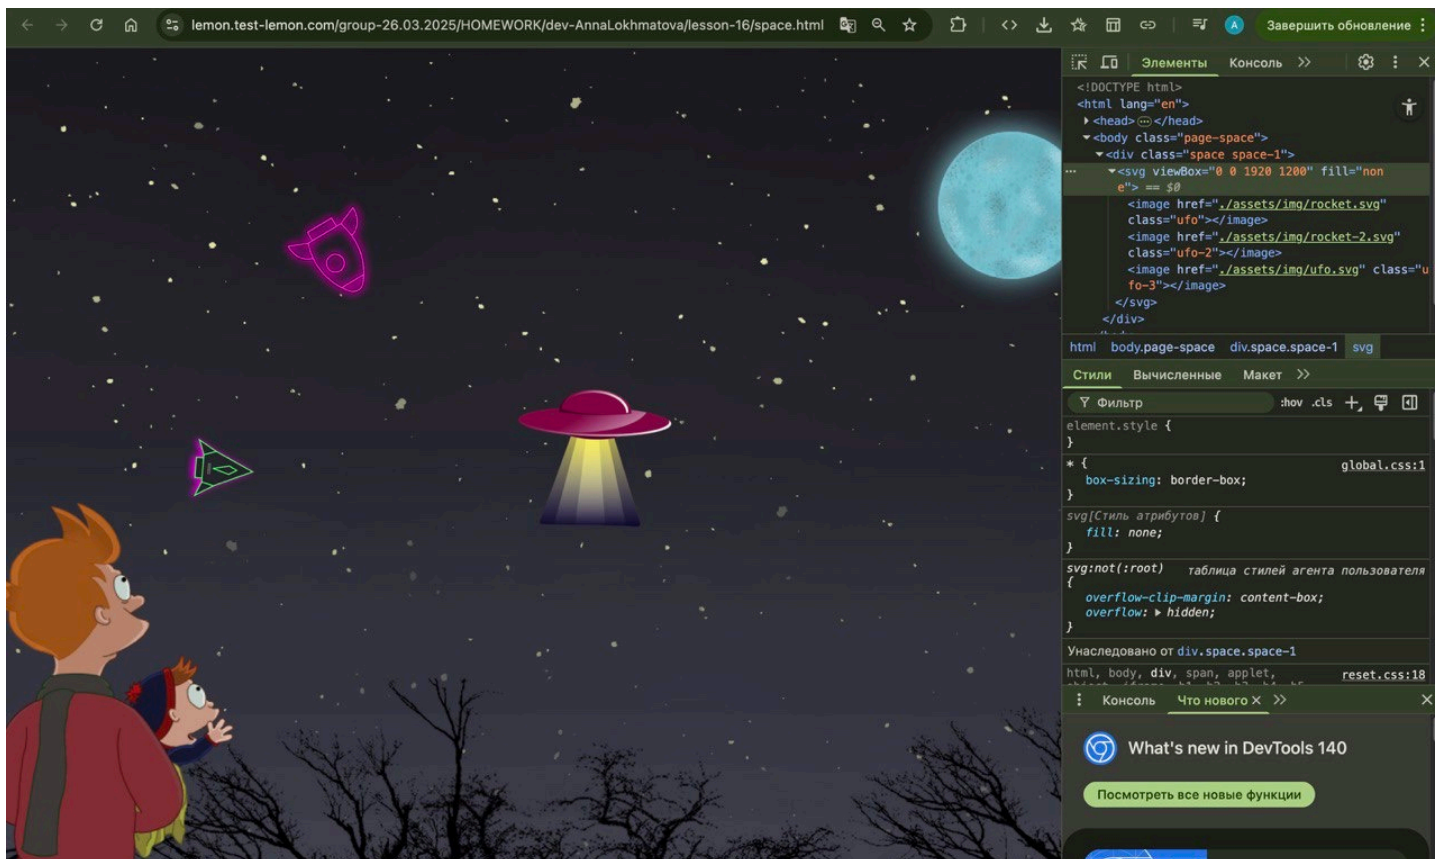

2. Farm Animation Project

SVG illustration, grouped elements, basic animation

SVG-based farm scene with cow and llama characters. Built vector animals out of SVG groups, then animated body parts (head, legs, tail) to create a playful motion effect. Used flex layout for the page structure and inspected SVG code in DevTools to understand how separate paths form the final illustration.
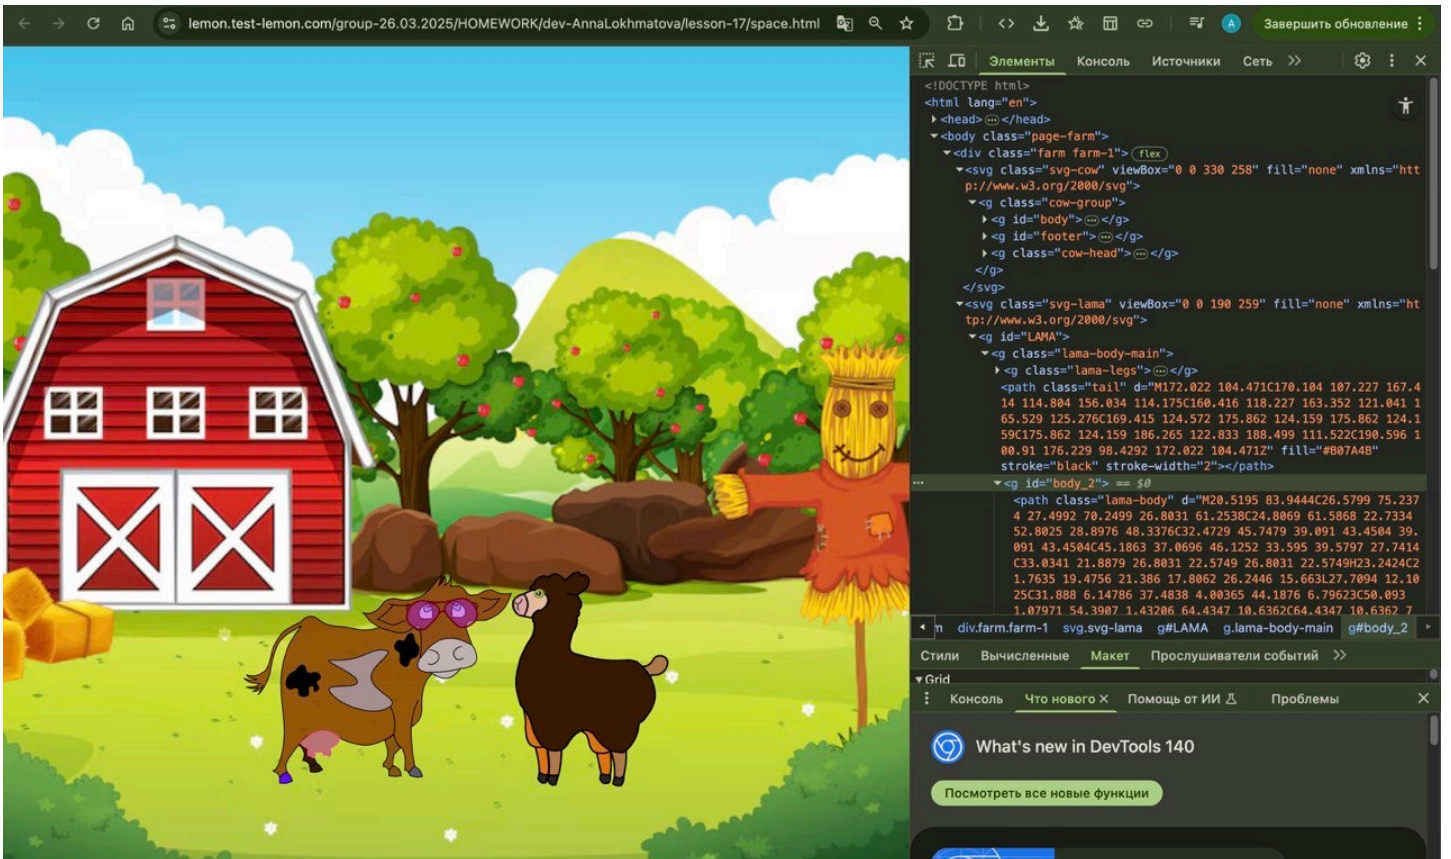

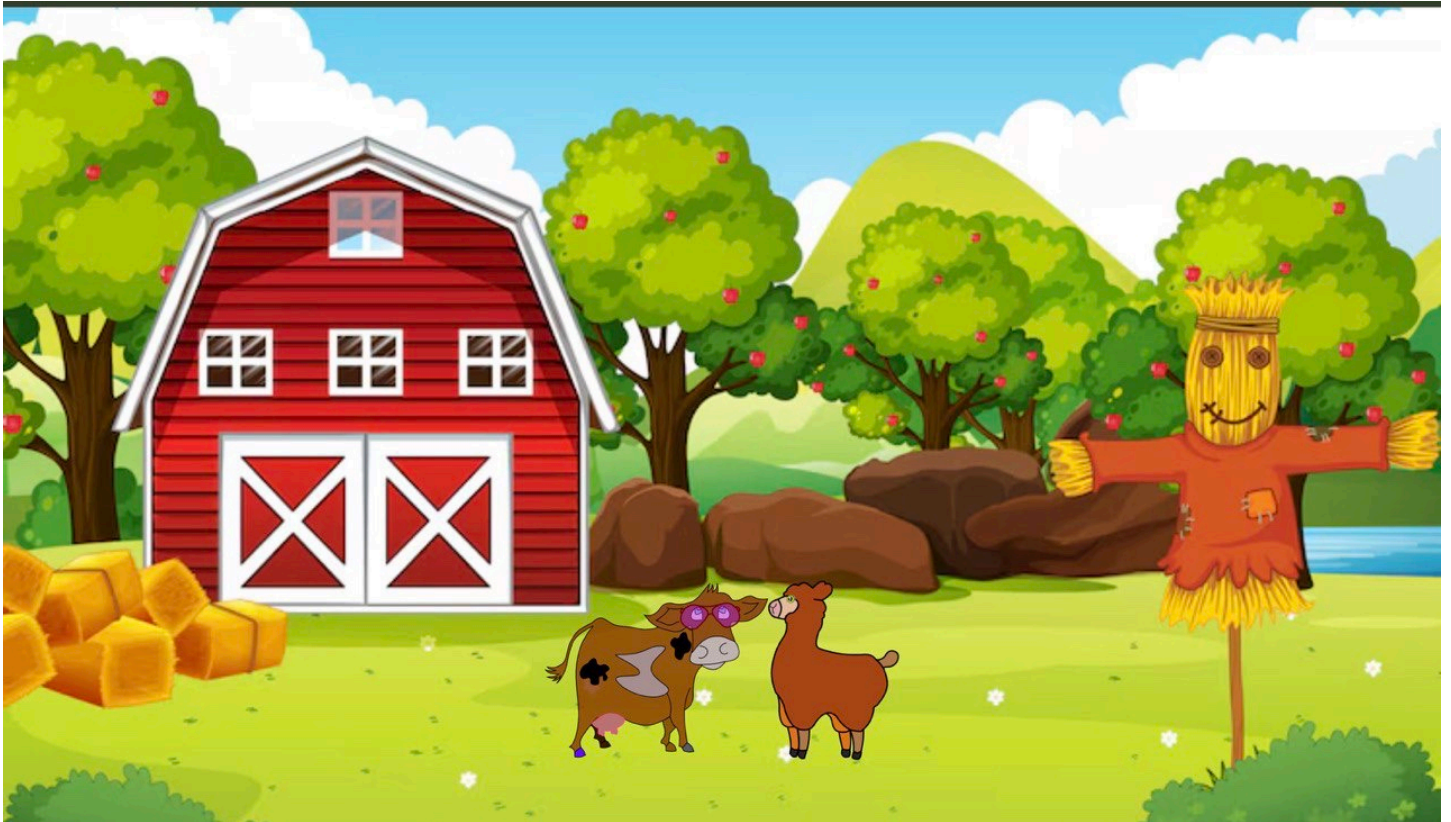

3. Bootstrap Cards Layout - Shop Page

Bootstrap grid, responsive cards

Product grid built with Bootstrap card components and responsive columns. Practised container/row/col structure, spacing utilities, and consistent image sizing to keep the layout clean on different screen widths.
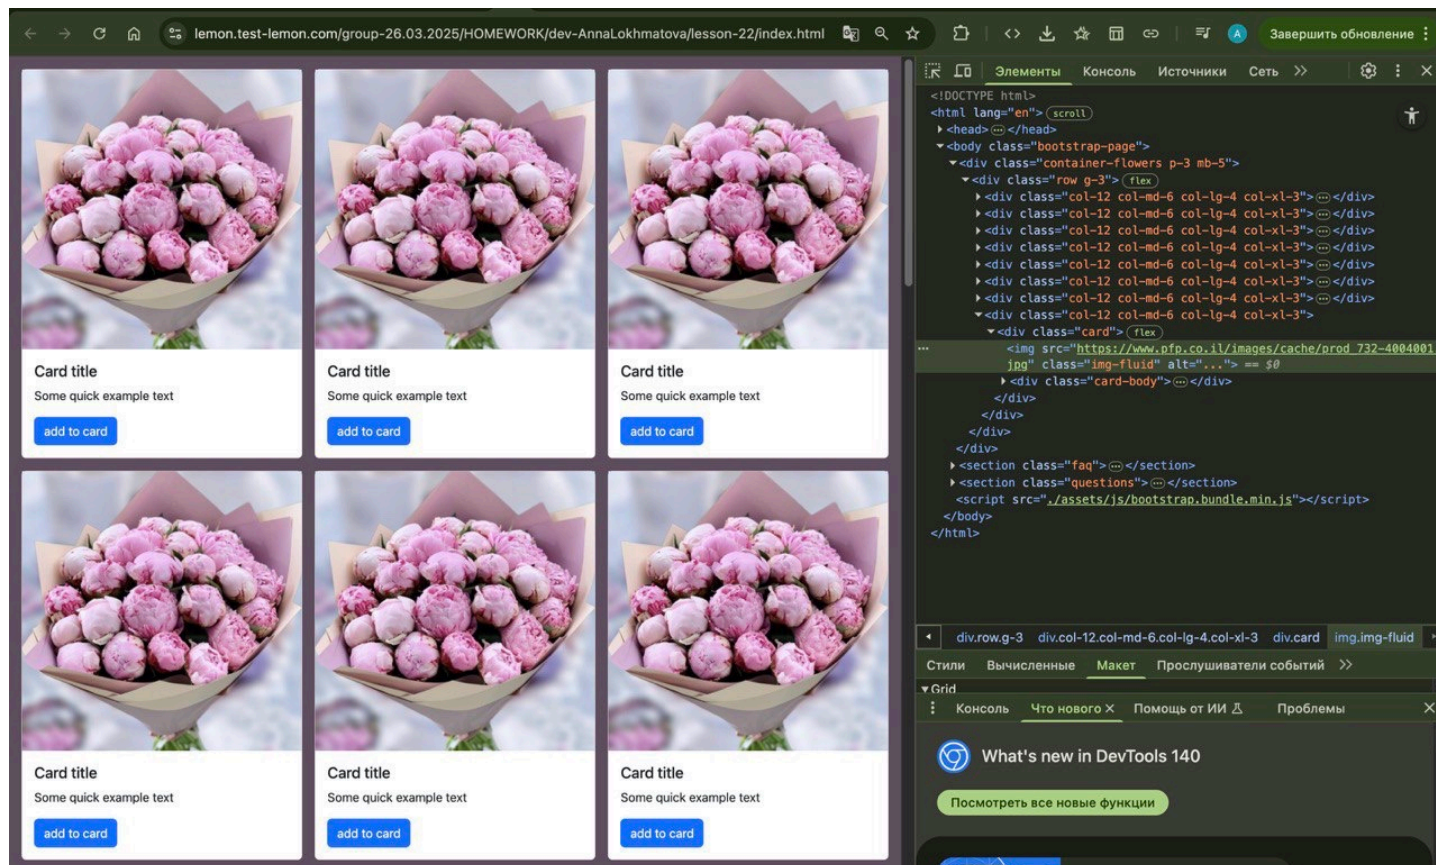

4. Bootstrap FAQ Section

Tabs, accordion, responsive layout

FAQ section implemented using Bootstrap nav tabs and accordion component. Configured collapse behaviour, interactive plus/minus icons and text blocks to keep long content readable while staying within a centred, responsive layout.
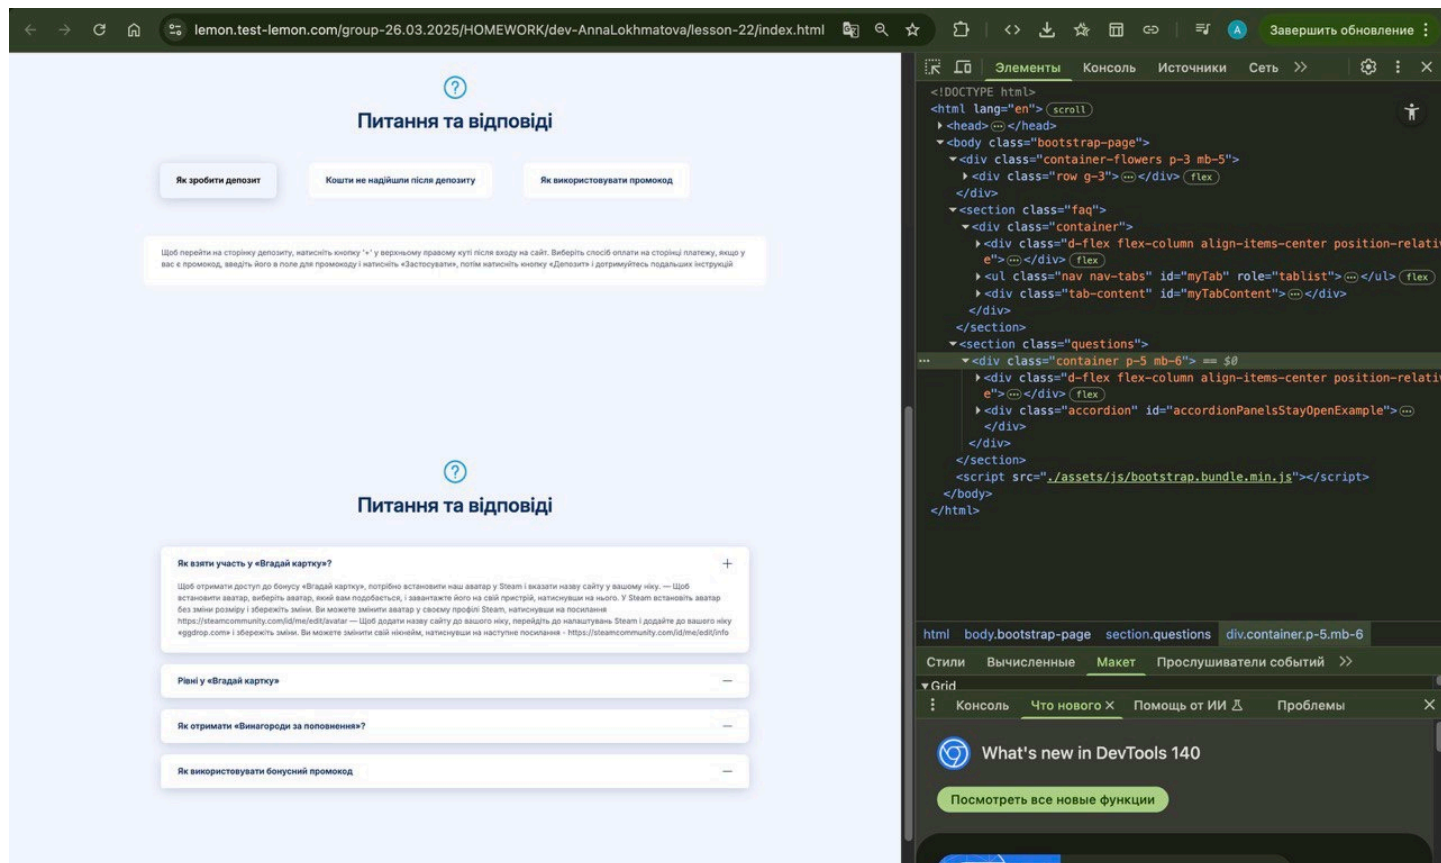

5. Pricing Plans Page

Flexbox layout, visual hierarchy, hover states

Pricing table with three plans and clear visual hierarchy. Used Flexbox for equal-height columns, gradient headers, icons and call-to-action buttons. Focused on typography, spacing and hover effects to make the main plan stand out while keeping the page easy to scan.
